Major forces reshaping Texas' electricity markets

1. "Disruptive Challenges" to Texas utilities

The way electricity is generated, sold and provided to customers in ERCOT is changing and is poised to change even more dramatically. Texas' retail energy provider (REP) space is ripe for disruption, particularly the major incumbents.

2. The paradox of cheap natural gas

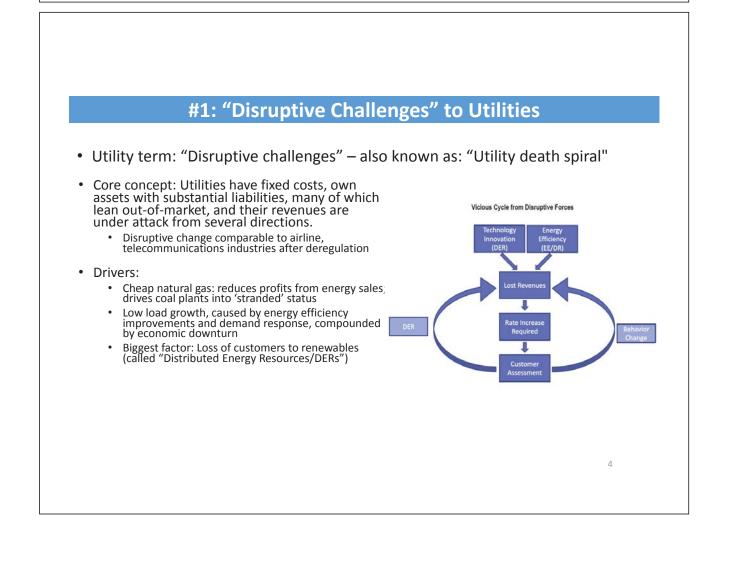

All forecasts call for substantial new gas generation to be built, and in fact ERCOT planners are relying on this new generation to maintain reliability. But persistently cheap natural gas has, counterintuitively, complicated new gas financings, and it is far from clear that ERCOT wholesale electricity prices will rise enough to support the forecast gas build.

3. 2010s Brawl: Wind vs. Solar

An epic intra-renewables clash has been brewing for a decade – wind has been the unquestioned champ of renewables in Texas, but solar is coming on strong. Dueling analyses forecast one or the other dominating. The one thing that is certain is that ERCOT will have front row seats to the fight.
