Forced Localization of Cloud Services: What are the Real Drivers?

Christopher Millard

Professor of Privacy and Information Law, Queen Mary University of London
Principal Investigator, Cloud Legal Project & Microsoft Cloud Computing Research Centre
Senior Counsel, Bristows LLP

Why is cloud computing regulation so hot now?

- The explosive growth in online, scalable, IT resources on demand is **disruptive**, technically, commercially, and legally
- Many concerns relate to **compliance** and **liability**, including transparency, control, and security
- Revelations of massive and systematic **government surveillance** haven't exactly boosted confidence in cloud
- The Internet is a global network of networks, but **geography still matters**
- Huge data pipes and hyper-scale data centers provide many **opportunities for regulatory intervention**

‘Clouds’ involve lots of physical infrastructure

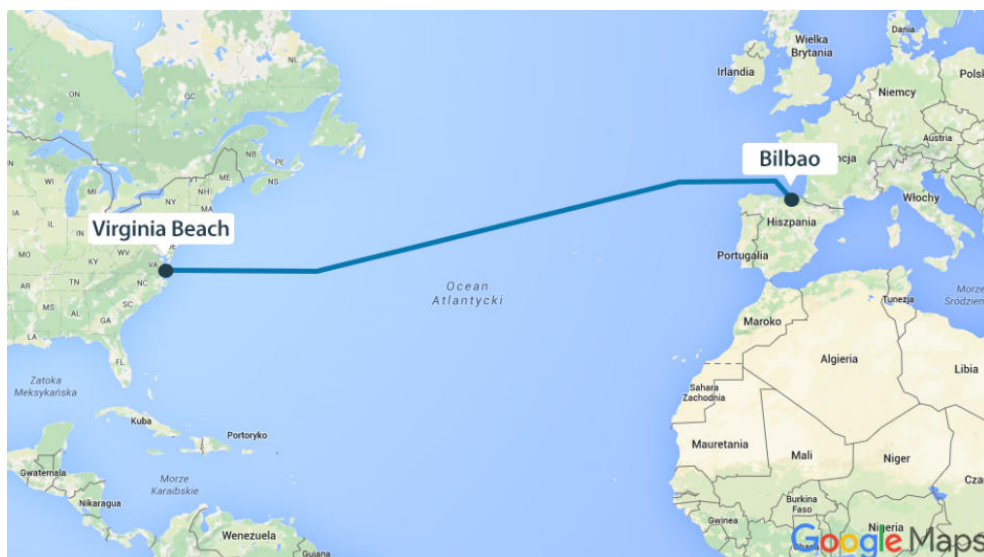

- Hyper-scale data centers are proliferating
- Substantial requirements for power and connectivity
- Data centres come in various shapes and sizes
