# Cryptocurrency and Blockchain Overview

What is a cryptocurrency?

- Intangible store of value
- Distributed, linked and managed through a blockchain—
  via a distributed ledger
- Each new "block" is identified by a unique cryptographic hash
  - The hash is obtained through solving a complex math problem in a process called "mining"
- Not typically backed by a government or tangible asset
  - Potential exceptions regarding government backing
    - Venezuela; Petro (launched Feb. 2018)
  - Potential exception for newly developed "stable" coins (e.g., backed by U.S. dollar or gold)

### Cryptocurrency and Blockchain Overview

Why does cryptocurrency exist?

- Started in 2009; October 31, 2008, a white paper by Satoshi Nakamoto published
- Social reaction to 2008 financial crises, problems with banking system
- The following block of text was embedded in the first ("genesis") block of Bitcoin:
  - "The Times 03/Jan/2009 Chancellor on the brink of second bailout for banks."
- There is continuing commentary regarding the social repercussions of the financial crisis on the behavior of millennials and distrust for banks

## Cryptocurrency and Blockchain Overview

Blockchain Overview

- "Blockchain" is the underpinning technology
- "Blocks" of verified data are "chained" together to form a publicly available distributed ledger
- Each block contains a record of all transactions involving that block
- The entire chain is discernible (ownership could be obfuscated)

Blockchains rely on:

- Consensus to verify the chain's integrity
- Cryptography to provide proof of work
- Mining activity to provide a means to record new transactions
